SNIC

Swedish National Infrastructure for Computing

National research infrastructure that provides a balanced and cost-efficient set of resources and user support for large scale computation and data storage to meet the needs of researchers from all scientific disciplines and from all over Sweden (universities, university colleges, research institutes, etc).

Broad Range of Training

Summer School Introduction to HPC held every year

Specific Courses Programming with GPGPU, Distributed and Parallel

Computing and/or Cloud Computing, Software Development
Tools, CodeRefinery workshops, etc

PDC User Days PDC Pub and Open House

Support and System Staff

First-line support

Provide specific assistance to PDC users related to accounts, login, allocations etc.

System staff

System managers/administrators ensure that computing and storage resources run smoothly and securely.

Application Experts

Hold PhD degrees in various fields and specialize in HPC. Assist researchers in optimizing, scaling and enhancing scientific codes for current and next generation supercomputers.

Beskow - Cray XC40 system

Fastest machine in Scandinavia

- Lifetime: Q4 2019
- 11 racks. 2060 nodes
- Intel Haswell processor 2.3 GHz Intel Broadwell processor 2.1 GHz
- 67,456 cores 32(36) cores/node
- Aries Dragonfly network topology
- 156.4 TB memory 64(128) GB/node

- 1 XC compute blade
- 1 Aries Network Chip (4 NICs)
- 4 Dual-socket Xeon nodes
- 4 Memory DIMM / Xeon node

Tegner

pre/post processing for Beskow

5 x 2TB Fat nodes

- 4×12 core Ivy Bridge, 2TB RAM
- 2 x Nvidia Quadro K420

5 x 1TB Fat nodes

- 4 x 12 core Ivy Bridge, 1TB RAM
- 2 x Nvidia Quadro K420

46 Thin Nodes

2 x 12 core Haswell, 512GB RAM Nvidia Quadro K420 GPU

9 K80 Nodes

2 x 12 core Haswell, 512GB RAM Nvidia Tesla K80 GPU

- Used for pre/post processing data
- Has large RAM nodes
- Has nodes with GPUs
- Has two transfer nodes
- Lifetime: Q4 2019

Summary of PDC resources

	Beskow	Tegner	
Cores in each node	32/36	48/24	
Nodes	1676 Haswell	55 x 24 Haswell/GPU	
	384 Broadwell	10 x 48 lvy bridge	
RAM (GB)	1676 x 64GB	55 x 512GB	
	384 x 128GB	5 x 1TB	
		5 x 2TB	
Allocations			
(core hours per month)			
Small	< 5 <i>k</i>	< 5k	
Medium	< 200 <i>k</i>	< 80 <i>k</i>	
Large	$\geq 200k$		
Allocation via SNIC	yes	yes	
AFS	login node only	yes K	
Lustre	yes	yes	

File Systems

Andrew File System (AFS)

- Distributed file system accessible to any running AFS client
- Home directory
 /afs/pdc.kth.se/home/[initial]/[username]
- Access via Kerberos tickets and AFS tokens
- Not accessible to compute nodes on Beskow

Lustre File System (Klemming)

- Open-source massively parallel distributed file system
- Very high performance (5PB storage 130GB/s bandwidth)
- NO backup (always move data when done) NO personal quota
- Home directory /cfs/klemming/nobackup/[initial]/[username]

Access requirements

User account either SUPR or PDC Time allocation set the access limits

Apply for PDC account via SUPR

- http://supr.snic.se
- SNIC database of persons, projects, project proposals and more
- Apply and link SUPR account to PDC
- Valid post address for password

Apply for PDC account via PDC

- https://www.pdc.kth.se/support → "Getting Access"
- Electronic copy of your passport
- Valid post address for password
- Membership of specific time allocation

Time Allocations

Small allocation

- Applicant can be a PhD student or more senior
- Evaluated on a technical level only
- Limits is usually 5K corehours each month

Medium allocation

- Applicant must be a senior scientist in Swedish academia
- Evaluated on a technical level only
- On large clusters: 200K corehours per month

Large allocation

- Applicant must be a senior scientist in Swedish academia
- Need evidence of successful work at a medium level
- Evaluated on a technical and scientific level
- Proposal evaluated by SNAC twice a year

Using resources

- All resources are free of charge for Swedish academia
- Acknowledgement are taken into consideration when applying
- Please acknowledge SNIC/PDC when using these resources:

Acknowledge SNIC/PDC

The computations/simulations/[SIMILAR] were performed on resources provided by the Swedish National Infrastructure for Computing (SNIC) at [CENTERNAME (CENTER-ACRONYM)]

Acknowledge people

NN at [CENTER-ACRONYME] is acknowledged for assistance concerning technical and implementation aspects [OR SIMILAR] in making the code run on the [OR SIMILAR] [CENTER-ACRONYM] resources.

Authentication

Kerberos Authentication Protocol

Ticket

- Proof of users identity
- Users use passwords to obtain tickets
- Tickets are cached on the user's computer for a specified duration
- Tickets should be created on your local computer
- No passwords are required during the ticket's lifetime

Realm

Sets boundaries within which an authentication server has authority (NADA.KTH.SE)

Principal

Refers to the entries in the authentication server database (username@NADA.KTH.SE)

Kerberos commands

```
Normal commands: On KTH-Ubuntu machines:
```

```
kinit generates ticket pdc-kinit
klist lists kerberos tickets pdc-klist
kdestroy destroys ticket file pdc-kdestroy
kpasswd changes password pdc-kpasswd
```

```
\ kinit --forwardable username@NADA.KTH.SE
```

\$ klist -Tf

```
Credentials cache : FILE:/tmp/krb5cc_500
Principal: username@NADA.KTH.SE
Issued Expires Flags Principal
Mar 25 09:45 Mar 25 19:45 FI krbtgt/NADA.KTH.SE@NADA.KTH.SE
Mar 25 09:45 Mar 25 19:45 FA afs/pdc.kth.se@NADA.KTH.SE
```

Login using Kerberos tickets

Get a 7 days forwardable ticket on your local system

\$ kinit -f -l 7d username@NADA.KTH.SE

Forward your ticket via ssh and login

- \$ ssh
 - -o GSSAPIDelegateCredential=yes
 - -o GSSAPIAuthentication=yes
 - $\hbox{-o GSSAPIKeyExchange=yes}\\$

username@clustername.pdc.kth.se

OR, when using ~/.ssh/config

\$ ssh username@clustername.pdc.kth.se

Always create a kerberos ticket on your local system https://www.pdc.kth.se/support/documents/login/login.html

Outline

- PDC Overview
- 2 Infrastructure
 - Beskow
 - Tegner
- Accounts
 - Time allocations
 - Authentication
- Development
 - Building
 - Modules
 - Programming environments
 - Compilers
- Running jobs
 - SLURM
- 6 How to get help

Compiling, Linking and Running Applications on HPC clusters

```
source code C / C++ / Fortran ( .c, .cpp, .f90, .h )
   compile Cray/Intel/GNU compilers
   assemble into machine code (object files: .o, .obj )
    link Static Libraries (.lib, .a )
        Shared Library (.dll, .so )
        Executables (.exe, .x )
```

request allocation submit job request to SLURM queuing system salloc/sbatch

run application on scheduled resources
 aprun/mpirun

Modules

The modules package allow for dynamic add/remove of installed software packages to the running environment

Loading modules

```
module load
             <software_name>
module add <software_name>
module use <software_name>
```

Swapping modules

```
module swap <software_name_1> <software_name_2>
```

Unloading modules

module unload <software_name>

Modules

Displaying modules

```
$ module list
Currently Loaded Modulefiles:
 1) modules/3.2.6.7
 20) PrgEnv-cray/5.2.56
```

```
$ module avail [software_name]
      ------/opt/modulefiles ------
gcc/4.8.1 gcc/4.9.1(default) gcc/4.9.2 gcc/4.9.3 gcc/5.1.0
```

```
$ module show software name
   conflict gcc
prepend-path PATH /opt/gcc/4.9.1/bin
prepend-path MANPATH /opt/gcc/4.9.1/snos/share/man
prepend-path LD_LIBRARY_PATH /opt/gcc/4.9.1/snos/lib64
setenv GCC_PATH /opt/gcc/4.9.1
```

Programming Environment Modules

specific to Beskow

```
Cray $ module load PrgEnv-cray Intel $ module load PrgEnv-intel GNU $ module load PrgEnv-gnu
```

- cc source.c
- CC source.cpp
- \$ ftn source.F90

Compiler wrappers : cc CC ftn

Advantages

Compiler wrappers will automatically

- link to BLAS, LAPACK, BLACS, SCALAPACK, FFTW
- use MPI wrappers

Disadvantage

Sometimes you need to edit Makefiles which are not designed for Cray

PDC Aug 2018

Compiling serial and/or parallel code

specific to Tegner

GNU Compiler Collection (gcc)

Portland Group Compilers (pgi)

```
$ module load pgi
$ pgcc -mp source.c
$ pgcpp -mp source.cpp
$ pgf90 -mp source.F90
```

Intel compilers (i-compilers)

```
$ module load i-compilers
$ icc -openmp source.c
$ icpc -openmp source.cpp
$ ifort -openmp source.F90
```

\$ module add i-compilers intelmpi

```
$ mpiicc -openmp source.c
```

\$ mpiicpcp -openmp source.cpp
\$ mpiifort -openmp source.F90

CUDA compilers (cuda)

```
$ module load cuda
```

\$ nvcc source.cu
\$ nvcc -arch=sm_37 source.cu

Outline

- PDC Overview
- Infrastructure
 - Beskow
 - Tegner
- Accounts
 - Time allocations
 - Authentication
- Development
 - Building
 - Modules
 - Programming environments
 - Compilers
- 6 Running jobs
 - SLURM
- 6 How to get help

How to run programs

- After login we are on a login node used only for:
 - submitting jobs,
 - editing files,
 - compiling small programs,
 - other computationally light tasks.
- Never run calculations interactively on the login node
- Instead, request compute resources interactively or via batch script
- All jobs must be connected to a time allocation
- For courses, PDC sets up a reservation for resources
- To manage the workload on the clusters, PDC uses a queueing/batch system

SLURM workload manager

Simple Linux Utility for Resource Management

- Open source, fault-tolerant, and highly scalable cluster management and job scheduling system
 - Allocates exclusive and/or non-exclusive access to resources for some duration of time
 - Provides a framework for starting, executing, and monitoring work on the set of allocated nodes
 - Arbitrates contention for resources by managing a queue
- Job Priority computed based on

Age the length of time a job has been waiting

Fair-share the difference between the portion of the computing resource that has been promised and the amount of resources that has been consumed

Job size the number of nodes or CPUs a job is allocated Partition a factor associated with each node partition

Interactive session

salloc

Request an interactive allocation of resources

```
$ salloc -A <account> -t <d-hh:mm:ss> -N <nodes>
salloc: Granted job allocation 123456
```

Run application on **Beskow**

```
$ aprun -n <PEs> -d <depth> -N <PEs_per_node> ./binary.x
#PEs - number of processing elements
#depth - number of threads (depth) per PE
#PEs_per_node - PEs per node
```

Run application on **Tegner**

```
$ mpirun -np <cores> ./binary.x
```

Launch batch jobs

sbatch

```
Submit the job to SLURM queue $ sbatch <script>
Submitted batch job 958287
```

The script should contain all necessary data to identify the account and requested resources

```
Example of request to run myexe for 1 hour on 4 nodes \#!/\text{bin/bash} -1
```

```
#SBATCH -A summer-2017

#SBATCH -J myjob

#SBATCH -t 1:00:00

#SBATCH --nodes=4

#SBATCH --ntasks-per-node=32

#SBATCH -e error_file.e

#SBATCH -o output_file.o

aprun -n 128 ./myexe > my_output_file 2>&1
```

Monitoring and/or cancelling running jobs

squeue -u \$USER

Displays all queue and/or running jobs that belong to the user

```
cira@beskow-login2: "> squeue -u cira

Outline

- PDC Overview
- Infrastructure
 - Beskow
 - Tegner
- Accounts
 - Time allocations
 - Authentication
- Development
 - Building
 - Modules
 - Programming environments
 - Compilers
- Running jobs
 - SLURM
- 6 How to get help

How to start your project

- Proposal for a small allocation
- Develop and test your code
- Run and evaluate scaling
- Proposal for a medium (large) allocation

PDC support

- Many questions can be answered by reading the web documentation: https://www.pdc.kth.se/support
- Preferably contact PDC support by email: support@pdc.kth.se
 - you get a ticket number.
 - always include the ticket number in follow-ups/replies they look like this: [SNIC support #12345]
- Or by phone: +46 (0)8 790 7800
- You can also make an appointment to come and visit.

PDC Aug 2018

How to report problems

support@pdc.kth.se

- Do not report new problems by replying to old/unrelated tickets.
- Split unrelated problems into separate email requests.
- Use a descriptive subject in your email.
- Give your PDC user name.
- Be as specific as possible.
- For problems with scripts/jobs, give an example.
 Either send the example or make it accessible to PDC support.
- Make the problem example as small/short as possible.
- Provide all necessary information to reproduce the problem.
- If you want the PDC support to inspect some files, make sure that the files are readable.
- Do not assume that PDC support personnel have admin rights to see all your files or change permissions.

Questions...?

Hands-on exercise

Login

- Some configuration steps are needed to log in to PDC
- Depends on OS: https://www.pdc.kth.se/support/documents/login/login.html
- In short, Kerberos and SSH supporting GSSAPI key exchange must be installed
- If needed, you will receive help to connect from your own laptops

Exercises

- You will now practice key steps in using PDC resources
- The example source code and batch scripts can be found at /afs/pdc.kth.se/home/k/kthw/Public/pdc_test.tar.gz, or in the GitHub repository https://github.com/PDC-support/introduction-to-pdc (in the intro-course branch)

Hands-on exercise

Exercises

The exercises below will demonstrate:

- Kerberos creating and listing tickets
- 2 Login via command line or PuTTY, and where you end up on PDC
- 3 AFS home, information on your projects, /cfs/klemming
- Working with modules
- Compiling code
- Submitting jobs
- Running interactively

Further information

- https://www.pdc.kth.se/support
- https://hpc-carpentry.github.io/hpc-intro/
- https://software-carpentry.org/lessons/

Kerberos

- Two files should be created/edited to enable login to PDC, krb5.conf and (linux and mac) .ssh/config. For Windows, SSH configuration is done in PuTTY. Further information here: https://www.pdc.kth.se/support/documents/login/configuration.html
- Assuming that you have now configured Kerberos and SSH, create a forwardable Kerberos ticket
- List the ticket. Can you see if it is forwardable? What does all the jargon mean?

Kerberos

Answer

To create a forwardable Kerberos ticket, type:

```
$ kinit -f <username>@NADA.KTH.SE
```

To list your Kerberos tickets, type:

```
$ klist -f
```

The output will hopefully look similar to

Credentials cache: FILE:/tmp/krb5cc_H26527

Principal: kthw@NADA.KTH.SE

Issued Expires Flags Aug 3 16:41:51 2017 Aug 4 16:39:50 2017 FfA

Aug 3 16:41:52 2017 Aug 4 16:39:50 2017 fA

Principal krbtgt/NADA.KTH.SE@

afs/pdc.kth.se@NADA

The first line is your Kerberos ticket, the second line your AFS token.

Login

- Start by logging in to Beskow
- Where are you after login?
 - What is your current directory?
 - What's the name of the login node?
- Have a look at the currently running processes on the login node

Login

Answer

- On Linux/MacOS, type one of these (use PuTTY on Windows):
 - \$ ssh username@beskow.pdc.kth.se
 - \$ ssh -o GSSAPIDelegateCredentials=yes -o GSSAPIKeyExchange=yes
 -o GSSAPIAuthentication=yes username@beskow.pdc.kth.se
- After logging in, pwd shows your current directory:
 - \$ pwd

/afs/pdc.kth.se/home/u/username

- The hostname command shows the hostname of the login node:
 - \$ hostname
 beskow-login2.pdc.kth.se
- The top command shows a snapshot of currently running processes:
 - \$ top

AFS home, listing projects, /cfs/klemming

- Check your AFS disk quota (hint: you will need the fs command, type fs help to see available subcommands)
- Go to your klemming nobackup directory. Can you run fs there?
- Check which allocation(s) you belong to using the projinfo command
 - Check all options of projinfo using the -h flag
 - How much have your allocations been used, and for how long are they valid?

AFS home, listing projects, /cfs/klemming

Answer

 The fs 1q command shows the name of the AFS volume of your home directory, your disk quota and usage:

```
$ fs lq
```

 fs 1q only works on AFS. You can type df -h . instead, but there's no quota on your klemming usage:

```
$ df -h .
Filesystem Size Used Avail Use% Mounted on
...:/klemming 5.2P 4.4P 730T 86% /cfs/klemming
```

 The projinfo command accesses a database that contains logs of all allocations

```
$ projinfo
```

Working with modules

- List the modules that are currently loaded (hint: type module help)
- List all the modules that are available on Beskow
- List all available modules named PrgEnv
- Swap from the PrgEnv-cray to the PrgEnv-gnu module

Working with modules

Answer

• Listing all loaded modules and all available modules is done like this:

```
$ module list
```

- \$ module avail
- To list all modules matching a pattern (like PrgEnv), type
 \$ module avail PrgEnv
- To swap programming environments (i.e. compiler environments), type
 - \$ module swap PrgEnv-cray PrgEnv-gnu

After swapping these modules, the compiler wrappers CC, CC and ftn point to the GNU compilers (instead of the Cray compilers)

Compiling code

- Copy the tarball /afs/pdc.kth.se/home/k/kthw/Public/pdc_test.tar.gz to your nobackup directory, and unpack it
- Now compile the MPI example code hello_world_mpi.c
 - Do you need to load any MPI libraries?
 - What compiler will be used when using the cc compiler wrapper?

Compiling code

Answer

Copying and extracting the tarball to your klemming directory:

```
$ cd /cfs/klemming/nobackup/u/username # replace this!
$ cp /afs/pdc.kth.se/home/k/kthw/Public/pdc_test.tar.gz .
$ tar zxf pdc_test.tar.gz
```

\$ cd pdc_test

 When using the compiler wrappers CC, cc and ftn, no MPI or numerical libraries need to be loaded or linked to explicitly!

```
$ cc -o hello_world_mpi hello_world_mpi.c
```

• Which compiler did we just compile with?

```
$ cc --version
gcc (GCC) 4.9.1 20140716 (Cray Inc.)
```

Submitting jobs

- Open the batch script sbatch_beskow.sh in your favorite editor (emacs or vim)
 - Set the allocation ID to edu18.intropdc
 - Set that the job should run on two nodes, with 16 processes running on each node
 - Set the requested time of the job to 2 minutes
- Submit the job to the SLURM queue!
- Monitor the queue to see if your job is running
- What output did you get?

PDC Aug 2018

Submitting jobs

Answer

The allocation, number of nodes and time are set with these flags

```
#SBATCH -A edu18.intropdc
#SBATCH -t 0:02:00
#SBATCH --nodes=2
```

 If you want to run 32 MPI processes in total, with 16 processes on each node, both the -n and -N flags to aprun must be used:

```
aprun -n 32 -N 16 ./hello_world_mpi
```

The job is submitted and monitored like this:

```
$ sbatch sbatch_beskow.sh
$ squeue -u <username>
```

• The output gets written to a default filename:

```
$ cat slurm-2559495.out
```

Running interactively

- For this example, use the OpenMP code hello_world_openmp.c.
 - First compile it. Does it work to compile with cc -o hello_world_openmp hello_world_openmp.c?
 - Spoiler: it won't work, since you need to add an OpenMP compiler flag. Have a look in the Makefile to find the flag
- Now allocate an interactive node. Hint: you need to specify allocation, number of nodes and time.
- Run the compiled hello_world_openmp on the interactive node.
 Important: don't forget to use aprun
- How many OpenMP threads do you see? How do you set the number of threads?

Running interactively

Answer

- To compile the code with OpenMP support, do:
 - \$ cc -fopenmp -o hello_world_openmp hello_world_openmp.c
- To allocate an interactive node for 10 minutes:
 - $\$ salloc -A edu18.intropdc -t 0:05:0 -N 1
- To run the code using 32 threads, first set this environment variable and then run with aprun
 - \$ export OMP_NUM_THREADS=32
 - \$ aprun -n 1 -d 32 ./hello_world_openmp
 - # the -d (depth) isn't actually needed here

NOTE: aprun sends the job to the interactive compute node. Omitting aprun means the calculation will run on the login node.

Questions...?
